## Re-routing and reinstalling valve

### shower valve relocation

• This project involves relocating the shower valve and handle to the opposite wall of the shower enclosure. The task will require precise removal of tiles and cutting through drywall to access and modify the waterlines. Initially, a thorough inspection of the current setup will determine the optimal path for rerouting the plumbing, taking into account any structural elements such as studs or hidden utilities within the walls. The tiles surrounding the existing valve will be carefully removed to minimize damage during the process. Drywall will be cut on both the current and target walls to provide access to the plumbing. After shutting off the water supply, the existing waterlines will be disconnected and skillfully rerouted to the new location, ensuring all new connections are secure and leak-free. The shower valve and handle will be installed according to manufacturer specifications, followed by a pressure test to ensure no leaks are present. Please note that tile and drywall repair will not be part of our services. A final inspection will be conducted to ensure the relocated shower valve meets all functional requirements, in compliance with local building codes and safety regulations.

## The following installment payments

First Payment	<u>\$ 1,850.00</u>
---------------	--------------------

Total Amount	<u>\$ 1,850.00</u>
--------------	--------------------

- 1st Choice will be responsible for leaving everything working 100%
